A Project Submitted in Integrated Development Project -1 (IDP-1) requirement for the degree of Bachelor in Computer Science Engineering (BSc)

Department of CSE

The International University of Scholars, Bangladesh

[October 2024]

Declaration

This to certify that the project work entitled "**Backpack Moon Basic E-commerce Website**" has been carried out by **Md. Omar Faruk, Tarun Pain**, **Md. Farid Hasan**, **Md. Pias Hossain** and **Md. Boney Amin** in the Department of Computer Science Engineering (CSE), The International University of Scholars (IUS), Dhaka, Bangladesh. The above project work or any part of this work has not been submitted anywhere for the award of any degree or diploma.

Supervisor:

……

Arpita Roy

Lecturer, Department of CSE, IUS

Abstract

The Backpack Moon Basic E-commerce Website project explains about developing an application through A basic e-commerce website abstract for a backpack store outlines an online platform dedicated to selling various types of backpacks—such as travel, laptop, and outdoor bags—with essential features like a product catalog, secure checkout, and user accounts. To provide a simple, user-friendly digital storefront for customers to browse, compare, and purchase different styles of backpacks. Students, travelers, professionals, and outdoor enthusiasts looking for convenient online bag shopping. Displays items categorized by use (e.g., casual, school, hiking) with filters for price, color, and material. Enables users to add items, apply discount codes, and complete purchases using secure payment gateways.

Chapter 1

Introduction & Description

1.1 Introduction

Welcome to Backpack Basic, where functionality meets everyday style. In a world that moves fast, we believe your gear should keep up without weighing you down or overcomplicating your journey. Whether you are commuting to the office, navigating campus, or heading out for a weekend getaway, our curated collection of backpacks is designed to deliver effortless utility, clean aesthetics, and uncompromising durability.

We cut through the noise of over-engineered gear to focus on what truly matters: smart storage, ergonomic comfort, and timeless design. Every backpack in our catalog is crafted from premium, weather-resistant materials with thoughtful compartments that protect your tech, organize your essentials, and transition seamlessly from professional settings to outdoor adventures. At Backpack Basic, we don't just sell bags—we build dependable companions for your daily rhythm. Explore our collection and find the minimalist design built to carry your world effortlessly.

1.2 Scope:

The Backpack Basic e-commerce website is a direct-to-consumer digital platform designed to showcase, market, and sell minimalist, high-utility backpacks and accessories. The platform will deliver a frictionless, modern shopping experience optimized for both mobile and desktop users, emphasizing clean design and intuitive navigation to match the brand's aesthetic.

1.3 Objectives:

- Ecommerce websites make an online business interactive with easy sharing of reviews & timely surveys. Understanding your customer’s views about offerings and feedback system can improve them in real-time.

- 1.To make Ecommerce website which will help the organization to operate them in business-to-consumer(B2C) model.
- **Conversion Rate Optimization (CRO):** Build an intuitive, frictionless checkout journey designed to achieve an initial e-commerce conversion rate of 2% to 3% within the first six months of launch.
- **Performance & Speed:** Deliver a lightning-fast digital experience with page load times under 2 seconds and a Google Lighthouse performance score of 90+ across mobile and desktop devices.
- **Brand Alignment:** Translate the minimalist ethos of the brand into a clean, modern UI/UX design that reduces cognitive load and highlights product craftsmanship through high-resolution imagery and clear specifications.
- **Operational Efficiency:** Implement a robust, centralized Content Management System (CMS) that allows internal teams to effortlessly manage inventory, process orders, and update product catalogs in real time.
- **Mobile-First Experience:** Ensure 100% responsive functionality, prioritizing mobile performance to seamlessly capture the high volume of traffic originating from social media and mobile browsing.

1.4 Limitation:

- Though e-commerce offers many advantages to customers, business, society and nation, there are still some areas of concern that need to be addressed.
- Payment, Watchlist, and review system is not included in this project.
- This system is currently limited to few categories only.
- Advance shopping cart and inventory system for stock calculation is currently missing.

Chapter 2

Requirement & Software Specification

2.1 Hardware Requirements:

- Processor: At least 2.0 GHz
- RAM: At least 2 GB
- Or above

2.2 Software Requirements:

- Operating System: Windows
- Editor Tools: Visual Studio Code
- Web Browser: Google Chrome, Firefox, or any compatible update browser

2.3 Project Develop Languages:

There are two kinds of language used in “Backpack Moon Basic E-commerce Website”. One is Programming Language and the other is Markup Language. We have used HTML, CSS, JavaScript, Font-awesome and Bootstrap.

- Programming Language: JavaScript
- Markup Language: HTML
- Color Scripting Language: CSS
- Multi Device Responsive Development Framework: Bootstrap
- Front Design and Style: Font-awesome

2.4 Why We used to Develop the above Languages:

2.4.1 JavaScript:

JavaScript is one of the world's most popular programming languages. Virtually every personal computer in the world has at least one JavaScript interpreter on it and is in active use. JavaScript 's popularity is due entirely to its role as the scripting language of the WWW. JavaScript (JS) is an interpreter computer Programming language. It was originally implemented as part of a web browser, communicates asynchronously, and alters the document content that is displayed. JavaScript is the prototype-based scripting language that is dynamic, weakly typed, and has a first-class function. It is a multi-paradigm language, supporting object-oriented, imperative, and functional styles. JavaScript's use in applications outside web pages - for example in PDF documents, site-specific browsers, and desktop widgets is also significant.

2.4.2 HTML:

Hyper Text Markup Language (HTML) is the main markup language for creating web pages and other information that can be displayed in a web browser. The purpose of a web browser is to read HTML documents and compose them into visible or audible web pages. The browser does not display the HTML tags but uses the tags to interpret the content of the page. HTML elements form the building blocks of all websites. HTML allows images and objects to be embedded and can be used to create interactive forms. It provides a means to create structured documents by denoting structural semantics for text such as headings, paragraphs, lists, links, quotes and other items. It can embed scripts written in languages such as JavaScript which affect the behavior of HTML web pages. This is the markup script language for creating a web page. We have used it in a different section in my "Tour Management System" such as for making "Header & Footer" on the home page. Inbound and Outbound Title's information.

2.4.3 CSS:

Cascading Style Sheets (CSS) is a style sheet language used for describing the presentation semantics (the look and formatting) of a document written in a markup language. Its most common application is to style web pages written in HTML. CSS is designed primarily to enable the separation of document content (written in HTML or similar markup language) from document presentation, including elements such as the layout, colors, and fonts. It can also be used to allow the web page to display differently depending on the screen size or device on which it is being viewed. We have used this style sheet language in a different section of my project. Such as “Admin Panel” Design Home Page “Top Navigation Drop Down Bar” design.

2.4.4 Bootstrap:

Bootstrap is a free and open-source CSS framework directed at responsive, mobile-first front-end web development. It contains CSS- and (optionally) JavaScript-based design templates for typography, forms, buttons, navigation, and other interface components. Bootstrap is an HTML, CSS and JS library that focuses on simplifying the development of informative web pages. The primary purpose of adding it to a web project is to apply Bootstrap's choices of color, size, font and layout to that project. As such, the primary factor is whether the developers in charge find those choices to their liking. Once added to a project, Bootstrap provides basic style definitions for all HTML elements. The result is a uniform appearance for prose, tables and form elements across web browsers. In addition, developers can take advantage of CSS classes defined in Bootstrap to further customize the appearance of their contents.

2.5 System Analysis & Design

Considering the fact that this project involves design and implementation of a software system regardless that is web-based, it will be important to mention and consider some models used in software development and deployment, some general models of software development are namely:

The waterfall model fits the development of this website. The main aim of using this approach is we can focus on each part of the model during development and come back to it if need be. The project can easily de broken down into different parts based on this model.

This is the model that will be used to develop the E-Commerce system. However, feedback loops will be allowed during the whole software development process. The model chosen for this project has to favors two developers for a project. Because we are the only ones who are going to implement this project. We find this model suitable for us to follow.

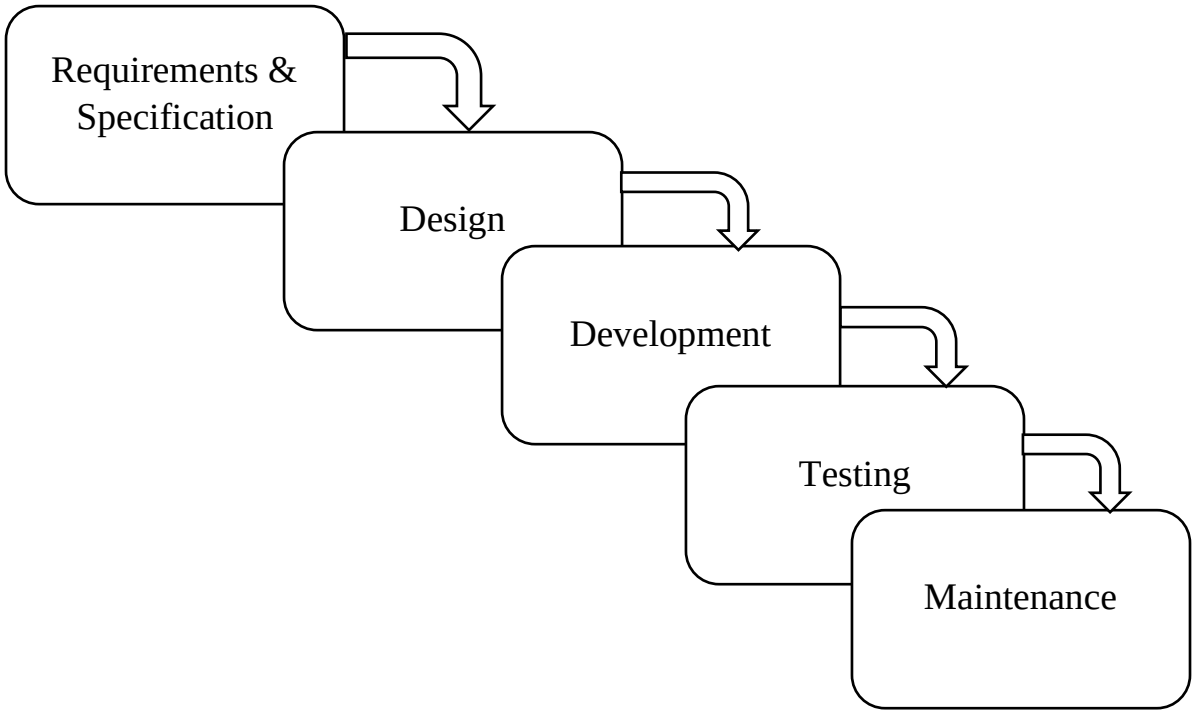

Fig: Waterfall Model- 3.5

Chapter 4

Conclusion & Future Development

4.1 Conclusion: -

We have successfully finished our Student Document Management System. The application was tested very well and the errors were properly debugged. Testing also concluded that the performance of the system is satisfactory. All the necessary output is generated. This system thus provides an easy way to automate all the functionalities of consumption. If this application is implemented in a few consumptions, it will be helpful. Further enhancements can be made to the project so that the website functions in a very attractive and useful manner than the present one. It is concluded that the application works well and satisfies the needs. The application is tested very well and errors are properly debugged. It also acts as the sharing of files the valuable resources. This system, being the first We have created in PHP, has proven more difficult than originally imagined. While it may sound simple to fill out a few forms and process the information, much more is involved in the selection of applicants than this. Every time progress was made and features were added, ideas for additional features or methods to improve the usability of the system made themselves apparent. Furthermore, adding one feature meant that another required feature was now possible, and balancing completing these required features with the ideas for improvement as well as remembering everything that had to be done was a project in itself. Debugging can sometimes be a relatively straightforward process, or rather finding out what you must debug can be. Since so many parts of the application system are integrated into one another, if an error occurs on one page, it may be a display error, for example; it may be the information is not correctly read from the database or even that the information is not correctly stored in the database initially, and all three must be checked on each occasion. This slows down the process and can be frustrating if the apparent cause of a problem is not obvious at first. The language used must be simple and easy to understand and compatibility is paramount. Overall, the system performs well, and while it does not include all of the features that may have been desired, it lives up to initial expectations. The majority of features that are included work flawlessly and the errors that do exist are minor or graphical. We sincerely hope that our application processing process will help to effectively communicate with their teachers and students in any educational institution.

4.2 Future Development: -

Future development is very important for each project because it includes the latest features in the system. It reduces software bugs and problems. It creates a strong relationship with the customer according to their feedback or choices. We will integrate some dynamic features in our project which features may integrate and are explained briefly.

When considering future development, basic backpack e-commerce website moves the platform from a simple product catalog and checkout to an intelligent, feature-rich online store.

Phase 1: Current Foundation (Minimum Viable Product)

Core Catalog: Simple listing of backpack models, colors, and prices.

Shopping Cart & Checkout: Basic add-to-cart functionality and standard payment processing.

Admin Panel: Manual inventory tracking and basic order status updates.

Phase 2: Short-Term Enhancements (3–6 Months)

Local Payment Integration: Add popular local payment gateways like bKash, Nagad, or SSLCommerz for regional buyers.

Advanced Search & Filters: Allow users to filter backpacks by size, waterproof capability, laptop compartment size, and price range.

User Accounts & Order Tracking: Enable customer profiles for order history, saved addresses, and live shipping status.

Phase 3: Medium-Term Growth (6–12 Months)

Product Reviews & Ratings: Allow customers to upload photos and leave feedback to build buyer trust.

Automated Inventory Alerts: Send low-stock alerts to the admin dashboard and display "Only X items left" to shoppers.

Wish list & Comparison Tool: Let users save favorite backpacks and compare two or three models side by side.

Phase 4: Long-Term Scaling (1–2 Years)

AI Product Recommendations: Suggest matching travel accessories, rain covers, or wallets based on browsing history.

Live Chat Support: Integrate an AI Chabot or live agent widget to answer sizing and shipping questions instantly.

Loyalty & Referral Program: Reward repeat buyers with discount points and offer referral bonuses for sharing the store.

Mobile App Development:

Mobile-First Access: Create mobile apps for both students and administrators, enabling document uploads, tracking, and verification on the go. The mobile app should support push notifications for Transitioning a basic e-commerce website into a mobile app requires a structured roadmap that builds upon your existing web foundation.
